

Entropic Kingdom Series: Work Statement

Increasing tensions exist between the animal kingdom and human beings in the attempt to coexist. As man ignores the fragility of the environment, his disregard causes the animal kingdom to undergo subtle negative changes. Animal population is affected as the regularity of climate patterns are destroyed. Mammals compete for smaller spaces and temperature changes limit fish, bird and insect migration.

Using symbolism through the medium of photomontage, I illustrate a world that's been thrown out of kilter as a result of man's fulfillment of immediate, self-serving needs.
